The table below summarises the geometric issues observed across the polymeric chains and their fit to the experimental data. The red, orange, yellow and green segments indicate the fraction of residues that contain outliers for >=3, 2, 1 and 0 types of geometric quality criteria. A cyan segment indicates the fraction of residues that are not part of the well-defined cores, and a grey segment represents the fraction of residues that are not modelled. The numeric value for each fraction is indicated below the corresponding segment, with a dot representing fractions <=5%

2 Ensemble composition and analysis ⓘ

This entry contains 10 models. This entry does not contain polypeptide chains, therefore identification of well-defined residues and clustering analysis are not possible. All residues are included in the validation scores.

3 Entry composition ⓘ

There is only 1 type of molecule in this entry. The entry contains 646 atoms, of which 231 are hydrogens and 0 are deuteriums.

- Molecule 1 is a DNA chain called 5'-D(*GP*GP*TP*TP*TP*TP*GP*GP*CP*AP*GP*G P*GP*TP*TP*TP*TP*GP*GP*T)-3'.

4 Residue-property plots ⓘ

4.1 Average score per residue in the NMR ensemble

These plots are provided for all protein, RNA, DNA and oligosaccharide chains in the entry. The first graphic is the same as shown in the summary in section 1 of this report. The second graphic shows the sequence where residues are colour-coded according to the number of geometric quality criteria for which they contain at least one outlier: green = 0, yellow = 1, orange = 2 and red = 3 or more. Stretches of 2 or more consecutive residues without any outliers are shown as green connectors. Residues which are classified as ill-defined in the NMR ensemble, are shown in cyan with an underline colour-coded according to the previous scheme. Residues which were present in the experimental sample, but not modelled in the final structure are shown in grey.

5 Refinement protocol and experimental data overview ⓘ

The models were refined using the following method: *DISTANCE GEOMETRY AND SIMU-
LATED ANNEALING, DISTANCE RESTRAINED MOLECULAR DYNAMICS REFINEMENT
AND RELAXATION MATRIX INTENSITY REFINEMENT.*

Of the 100 calculated structures, 10 were deposited, based on the following criterion: *STRUC-
TURES WITH ACCEPTABLE COVALENT GEOMETRY, STRUCTURES WITH FAVORABLE
NON-BOND ENERGY,STRUCTURES WITH THE LEAST RESTRAINT VIOLATIONS,BACK-
CALCULATED DATA AGREE WITH EXPERIMENTAL NOESY SPECTRUM.*

The following table shows the software used for structure solution, optimisation and refinement.

6.1   Standard geometry ⓘ

The Z score for a bond length (or angle) is the number of standard deviations the observed value is removed from the expected value. A bond length (or angle) with $|Z| > 5$ is considered an outlier worth inspection. RMSZ is the (average) root-mean-square of all Z scores of the bond lengths (or angles).

Mol	Chain	Bond lengths		Bond angles	
		RMSZ	#Z>5	RMSZ	#Z>5
1	A	1.42±0.02	6±1/464 (1.2± 0.2%)	2.36±0.02	45±1/718 (6.3± 0.2%)
All	All	1.42	57/4640 (1.2%)	2.36	452/7180 (6.3%)

5 of 8 unique bond outliers are listed below. They are sorted according to the Z-score of the worst occurrence in the ensemble.

6.2   Too-close contacts ⓘ

In the following table, the Non-H and H(model) columns list the number of non-hydrogen atoms and hydrogen atoms in each chain respectively. The H(added) column lists the number of hydrogen

atoms added and optimized by MolProbity. The Clashes column lists the number of clashes averaged over the ensemble.

1	A	415	231	231	22±5
All	All	4150	2310	2310	219

The all-atom clashscore is defined as the number of clashes found per 1000 atoms (including hydrogen atoms). The all-atom clashscore for this structure is 34.
