The following experimental techniques were used to determine the structure:

## ELECTRON MICROSCOPY

The reported resolution of this entry is $4.80 \AA$.
Percentile scores (ranging between $0-100$ ) for global validation metrics of the entry are shown in the following graphic. The table shows the number of entries on which the scores are based.

| Metric | Whole archive <br> (\#Entries) | EM structures <br> (\#Entries) |
| :---: | :---: | :---: |
| Clashscore | 158937 | 4297 |
| Ramachandran outliers | 154571 | 4023 |
| Sidechain outliers | 154315 | 3826 |

The table below summarises the geometric issues observed across the polymeric chains and their fit to the map. The red, orange, yellow and green segments of the bar indicate the fraction of residues that contain outliers for $>=3,2,1$ and 0 types of geometric quality criteria respectively. A grey segment represents the fraction of residues that are not modelled. The numeric value for each fraction is indicated below the corresponding segment, with a dot representing fractions $<=5 \%$ The upper red bar (where present) indicates the fraction of residues that have poor fit to the EM map (all-atom inclusion $<40 \%$ ). The numeric value is given above the bar.

## 3 Residue-property plots (i)

These plots are drawn for all protein, RNA, DNA and oligosaccharide chains in the entry. The first graphic for a chain summarises the proportions of the various outlier classes displayed in the second graphic. The second graphic shows the sequence view annotated by issues in geometry and atom inclusion in map density. Residues are color-coded according to the number of geometric quality criteria for which they contain at least one outlier: green $=0$, yellow $=1$, orange $=2$ and red $=3$ or more. A red diamond above a residue indicates a poor fit to the EM map for this residue (all-atom inclusion $<40 \%$ ). Stretches of 2 or more consecutive residues without any outlier are shown as a green connector. Residues present in the sample, but not in the model, are shown in grey.

### 5.1 Standard geometry (i)

The Z score for a bond length (or angle) is the number of standard deviations the observed value is removed from the expected value. A bond length (or angle) with $|Z|>5$ is considered an outlier worth inspection. RMSZ is the root-mean-square of all Z scores of the bond lengths (or angles).

Chiral center outliers are detected by calculating the chiral volume of a chiral center and verifying if the center is modelled as a planar moiety or with the opposite hand.A planarity outlier is detected by checking planarity of atoms in a peptide group, atoms in a mainchain group or atoms of a sidechain that are expected to be planar.

## 6 Map visualisation

This section contains visualisations of the EMDB entry EMD-13065. These allow visual inspection of the internal detail of the map and identification of artifacts.

Images derived from a raw map, generated by summing the deposited half-maps, are presented below the corresponding image components of the primary map to allow further visual inspection and comparison with those of the primary map.

### 6.1 Orthogonal projections

### 6.4.1 Primary map

X

Y

Z

The images above show the 3D surface view of the map at the recommended contour level 0.15. These images, in conjunction with the slice images, may facilitate assessment of whether an appropriate contour level has been provided.

### 6.4.2 Raw map

These images show the 3D surface of the raw map. The raw map's contour level was selected so that its surface encloses the same volume as the primary map does at its recommended contour level.

### 6.5 Mask visualisation (i)

This section shows the 3D surface view of the primary map at $50 \%$ transparency overlaid with the specified mask at $0 \%$ transparency

A mask typically either:

- Encompasses the whole structure
- Separates out a domain, a functional unit, a monomer or an area of interest from a larger structure

## 7 Map analysis

This section contains the results of statistical analysis of the map.

### 7.1 Map-value distribution (i)

The map-value distribution is plotted in 128 intervals along the x -axis. The y -axis is logarithmic. A spike in this graph at zero usually indicates that the volume has been masked.

### 7.2 Volume estimate (i)

The volume at the recommended contour level is $201 \mathrm{~nm}^{3}$; this corresponds to an approximate mass of 182 kDa .

The volume estimate graph shows how the enclosed volume varies with the contour level. The recommended contour level is shown as a vertical line and the intersection between the line and the curve gives the volume of the enclosed surface at the given level.
7.3 Rotationally averaged power spectrum (i)

*Reported resolution corresponds to spatial frequency of $0.208 \AA^{-1}$

## 8 Fourier-Shell correlation (i)

Fourier-Shell Correlation (FSC) is the most commonly used method to estimate the resolution of single-particle and subtomogram-averaged maps. The shape of the curve depends on the imposed symmetry, mask and whether or not the two 3D reconstructions used were processed from a common reference. The reported resolution is shown as a black line. A curve is displayed for the half-bit criterion in addition to lines showing the 0.143 gold standard cut-off and 0.5 cut-off.

*Reported resolution corresponds to spatial frequency of $0.208 \AA^{-1}$

### 8.2 Resolution estimates (i)

| Resolution estimate ( $\AA$ ) | Estimation criterion (FSC cut-off) |  |  |
| :---: | :---: | :---: | :---: |
|  | 0.143 | 0.5 | Half-bit |
| Reported by author | 4.80 | - | - |
| Author-provided FSC curve | 4.77 | 6.15 | 4.81 |
| Unmasked-calculated* | 8.19 | 19.65 | 9.43 |

*Resolution estimate based on FSC curve calculated by comparison of deposited half-maps. The value from deposited half-maps intersecting FSC 0.143 CUT-OFF 8.19 differs from the reported value 4.8 by more than $10 \%$

## 9 Map-model fit (i)

This section contains information regarding the fit between EMDB map EMD-13065 and PDB model 7OTQ. Per-residue inclusion information can be found in section 3 on page 7 .

### 9.1 Map-model overlay <br>

The images above show the 3D surface view of the map at the recommended contour level 0.15 at $50 \%$ transparency in yellow overlaid with a ribbon representation of the model coloured in blue. These images allow for the visual assessment of the quality of fit between the atomic model and the map.

### 9.2 Atom inclusion (i)

At the recommended contour level, $98 \%$ of all backbone atoms, $86 \%$ of all non-hydrogen atoms, are inside the map.
